

Nuevo Observatorio Virtual Argentino

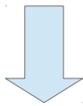

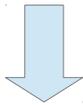

El repositorio de datos NOVA Acceso y visibilidad

Agosto 2015

- Software
- Participación: roles
- Situación actual
- Datos actuales
- Cómo consultar datos: ejemplos en Aladin y Python
- Cómo subir datos

- El software de NOVA es un adaptación del software alemán GAVO.

Publica documentos técnicos contando las características técnicas esperadas del software de los Observatorios Virtuales. Define protocolos.

VO Alemán – Desarrolla un software código abierto cumpliendo los documentos técnicos de IVOA.

Servidor centralizado GAVO.

Aumenta el software desarrollado por GAVO: página web propia, estadísticas, aplicaciones para subir datos automáticamente, etc.

Desarrollo de estándares para subir datos en Argentina.

Federalismo, organización y trabajo en conjunto.

- Acceso a los datos online
- Información sobre software disponible para acceder a los datos
- Acceso a datos a través de los protocolos de IVOA

NOVA hoy plantea dos objetivos:

Almacenamiento de Datos

Accesibilidad a los Datos

Pendiente

Lograr subir más datos

Resuelto

Los datos son accesibles via Web y herramientas VO

Servidor NOVA

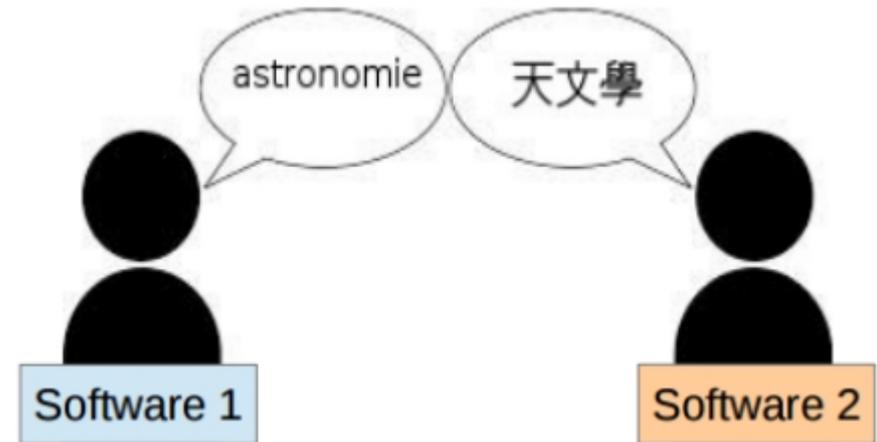

Datos en NOVA hoy

- 400.000.000 de registros del VVV Survey colaboración
Sebastián Gurovich ICATE
- Imágenes usadas en paper colaboración
Sergio Parón IAFE
- Espectros usados en papers colaboración
Roberto Gamen – Gabriel Ferrero IALP

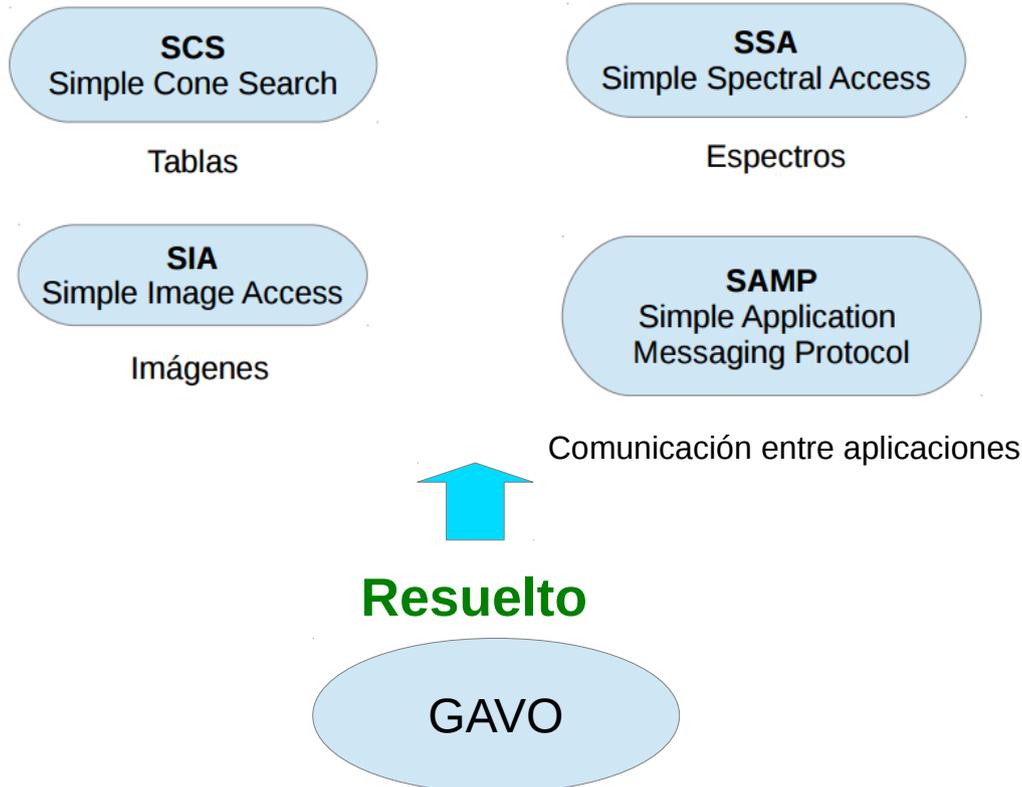

Pendiente

Subir más datos

- Se precisa compatir datos entre distintos programas (software)
- **Protocolo** es un conjunto de reglas para el **programador** que sirven para crear software que hable el mismo lenguaje y puedan intercambiarse datos.

- IVOA especificó entre otras los siguientes, entre otros.
- Concepto más técnico.
- A nivel usuario de datos, se incluye a modo informativo dado que pueden aparecer en los software de VO.

Ejemplos

- Aladin
- Python - astropy

The Aladin main interface is shown with the 'File' menu open. The menu items are: Open... (Ctrl+L), Open local file... (Ctrl+O), Open URL..., Recent files & URLs..., Progressive sky (HIPS), Load astronomical image, Load catalog, Load from the Virtual Observatory..., Load instrument FoV..., Save... (Ctrl+S), Save the current view..., Export the current view (EPS)..., Export planes (FITS, VOTable,...), Backup the stack..., Print... (Ctrl+P), New Aladin window... (Ctrl+N), and Quit. The main window displays a 'Bienvenue on Aladin,' message and a toolbar with icons for select, rgb, pan, assoc, dist, and crop. A yellow circle with the number '1' is placed over the 'Load from the Virtual Observatory...' menu item.

The 'Server selector' dialog box is open, showing a list of servers for the 'VO discovery tool'. The 'Target (ICRS, name)' field contains '282.000845833 -24.4088916663' and the 'Radius' is '14''. The 'Servers' section has 'Images' and 'Spectra' unchecked, and 'Catalogs' checked. A list of servers is shown, with 'VVO Survey Band Merged JHK' highlighted by a blue circle. A yellow circle with the number '2' is placed over the 'VVO Survey Band Merged JHK' entry. At the bottom, there are buttons for 'Reset', 'Clear', 'SUBMIT', and 'Close', along with a 'Stop it' button.

Astropy v1.1.dev13175 » Virtual Observatory Access (`astropy.vo`)

Page Contents

Virtual Observatory Access

(`astropy.vo`)

- Introduction

Virtual Observatory Access (`astropy.vo`)

Introduction

The `astropy.vo` subpackage handles simple access for Virtual Observatory (VO) services.

Current services include:

- VO Simple Cone Search
- SAMP (Simple Application Messaging Protocol (`astropy.vo.samp`))

Other third-party Python packages and tools related to `astropy.vo` :

- [PyVO](#) provides further functionality to discover and query VO services. Its user guide contains a [good introduction](#) to how the VO works.
- [Astroquery](#) is an Astropy affiliated package that provides simply access to specific astronomical web services, many of which do not support the VO protocol.
- [Simple-Cone-Search-Creator](#) shows how to ingest a catalog into a cone search service and serve it in VO standard format using Python (using CSV files and [healpy](#)).

```
from astropy.vo.samp import SAMPIntegratedClient
client = SAMPIntegratedClient()
client.connect()
params = {}
params["url"] = 'http://nova.iafe.uba.ar/getproduct/iafe/sparon/data/niriH.fits'
params["name"] = "MSX Band E Image of the Galactic Center"
message = {}
message["samp.mtype"] = "image.load.fits"
message["samp.params"] = params
client.notify_all(message)
client.disconnect()
```

PyVO v0.0.dev174 » PyVO User's Guide

Page Contents

[PyVO User's Guide](#)

PyVO User's Guide

PyVO is a package providing access to remote data and services of the Virtual Observatory (VO) using Python.

Contents

- [About the Virtual Observatory \(VO\)](#)
 - [Data Discovery and Access](#)
 - [Discovering Archives](#)
- [Installing PyVO](#)
- [Getting Started With PyVO](#)
 - [A Few Examples](#)
 - [What's available in the pyvo Module](#)
- [Data Access Services](#)
 - [Simple Image Access and the Common Interface Features](#)
 - [Simple Spectrum Access](#)
 - [Searching Catalogs with Simple Cone Search Services](#)
 - [Spectral Line Transitions and Simple Line Access](#)

```
import pyvo as vo

url = 'http://nova.iafe.uba.ar/vvvsurvey/q/scs/scs.xml?'
stars = vo.conesearch(url, pos=[282.08, -24.44], radius=0.05)
for src in stars:
    print("{0}:for src in stars: {1} {2} {3} {4} {5}".format(src.id, src.ra, src.dec, src['mag_k'],
src['mag_j'], src['mag_h']))
```

Subida de datos

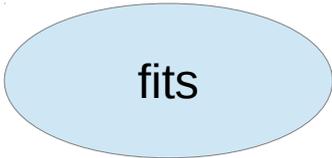

- La restricción que existe sobre los datos es que sean datos procesados y no “crudos”.
- Existen dos formas de subir datos a NOVA:
 - Usando el **Administrador de NOVA ó**
 - **Manual** - trabajando en conjunto con Técnico NOVA

Data Owner

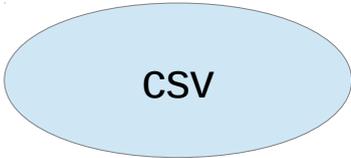

(1) Archivos originales de Datos

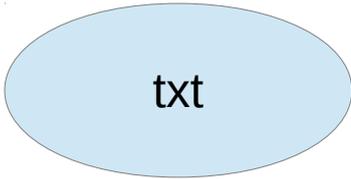

- Imágenes
- Espectros
- Tablas en archivos de texto, csv, separado por espacios, etc.
- Cubos
- *Series temporales*
- *Modelos*
